Waiomu Township

River Flood Hazard Map (100-year event)

Scale 1:1,000 @ A0

No Flood Hazard (dry area): Areas that are predicted to be unaffected during a 100-year flood event. These hazard areas are particularly important for identifying appropriate civil defence warden posts and evacuation areas.

Medium Flood Hazard (primary secondary flow path or primary ponding): Areas that are predicted to be affected by significant overland flow during a 100-year flood event.

High Flood Hazard (floodway): Areas that are predicted to be inundated by floodwaters during the 100-year flood event with a depth that is greater than 1 metre and a velocity that is greater than 1 metre per second.

Existing Hazards

Low Flood Hazard (secondary ponding): Areas that are predicted to be affected by relatively minor ponding during a 100-year flood event.

Parcel Boundaries

Limit of Hazard Assessment

The Flood Hazard areas have been based on anticipated flows from the 100-year return period event (1% AEP). The inundation mapping area may not be the maximum extent of inundation. The flood hazard assessment process was carried out in conjunction with Thames-Coromandel District Council. This process has been undertaken by Environment Waikato and The Thames-Coromandel District Council.
